Laboratory Procedures

LY411575 is supplied as a crystalline solid. A stock solution may be made by dissolving the LY411575 in the solvent of choice. LY411575 is soluble in the organic solvent dimethyl formamide, which should be purged with an inert gas, at a concentration of approximately 10 mg/ml. LY411575 is also slightly soluble in ethanol and DMSO.

Description

γ -Secretase is a multi-subunit aspartyl protease that regulates signaling pathways by proteolytically cleaving substrates, abrogating or releasing signaling molecules. One well-known substrate of this enzyme is Notch, a transmembrane receptor that plays a key role in cell fate decisions including cell proliferation, differentiation, and apoptosis. LY411575 is a cell-permeable γ -secretase inhibitor (IC_{50} = 0.14 nM) that has been shown to block Notch activation *in vitro* at 500 μ M.^{1,2} LY411575 can induce apoptosis in Kaposi's sarcoma cells as well as promote intestinal goblet cell differentiation in a mouse model of colitis.^{2,3} It has also been observed to promote neural differentiation of mouse embryonic stem cells.⁴
