PRODUCT INFORMATION

Nervonic Acid

Item No. 13940

CAS Registry No.:	506-37-6
Formal Name:	15Z-tetracosenoic acid
Synonym:	Selacholeic Acid
MF:	$C_{24}H_{46}O_{2}$
FW:	366.6
Purity:	≥95%
Supplied as:	A crystalline solid
Storage:	-20°C
Stability:	≥2 years

Information represents the product specifications. Batch specific analytical results are provided on each certificate of analysis.

Laboratory Procedures

Nervonic acid is supplied as a crystalline solid. A stock solution may be made by dissolving the nervonic acid in the solvent of choice. Nervonic acid is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide (DMF), which should be purged with an inert gas. The solubility of nervonic acid in ethanol is approximately 10 mg/ml and approximately 20 mg/ml in DMSO and DMF.

Nervonic acid is sparingly soluble in aqueous solutions. To enhance aqueous solubility, dilute the organic solvent solution into aqueous buffers or isotonic saline. If performing biological experiments, ensure the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. We do not recommend storing the aqueous solution for more than one day.

Description

Nervonic acid (24:1n-9) is a very long chain fatty acid produced by elongation of oleic acid (18:1n-9) (Item No. 90260) and derived from erucic acid (22:1n-9) (Item No. 90175).¹ It is enriched in nervous tissue and is particularly abundant in sphingolipids, such as sphingomyelin in the myelin sheath of nerve fibers.² Nervonic acid is poorly produced in demyelinating disorders, including multiple sclerosis and adrenoleukodystrophy, suggesting that dietary supplementation may be beneficial.³ In addition, it is deficient in mice which are homozygous for the guaking mutation, a model of Parkinson's disease.^{4,5} Nervonic acid also binds and inhibits DNA polymerase β (K_i = 4.0 uM) and HIV-1 reverse transcriptase (K_i = 1.2 μ M).⁶
